[A] ANTIINFLAMMATORY ACTIVITY :

(1) Carrageenin foot edema :

(1) Test Method :

20 Five male Sprague-Dawley rats weighing about 200 g were used per group.  
Paw edema was induced by subplantar injection of 1% carrageenin (0.1 ml/rat) into the right hind paw.  
The test drug was suspended in 0.5% methylcellulose  
25 and administered orally 60 minutes before phlogogen.  
Paw volume was measured with plethysmometer (Ugo Basil Co., Ltd.) by water displacement immersing the paw to the lateral malleolus. The difference of paw volume before and 3 hours after the phlogogen was designated  
30 as edema volume.  
The data were analyzed statistically by student's t-test.

animals were observed from 3 to 13 minutes after an  
intraperitoneal injection of 0.2 ml/10 g of 0.6% acetic  
acid. The drugs were given orally 60 minutes before  
10 acetic acid. The frequency of writhing syndrome in the  
treated animals was compared with that in the  
non-treated control animals.

#### Example 36

To a solution of N-(phenylcarbamoylimino)pyridinium ylide (0.64 g) in a mixture of ethanol (30 ml) and water (10 ml) was added sodium borohydride (0.20 g) at ambient temperature. After being stirred for 4 hours, the reaction mixture was acidified with 1N hydrochloric acid, concentrated to a volume of ca. 15 ml. The crystalline precipitate was collected, washed with water and dried in vacuo. The crude product was dissolved in ethyl acetate and extracted with 10% hydrochloric acid (20 ml). The extract was adjusted to

pH 3 with aqueous sodium bicarbonat and extracted with ethyl acetate (30 ml). The organic layer was washed with aqueous sodium bicarbonate (10 ml), dried over magnesium sulfate and evaporated to give N-(phenyl-carbamoylamino)-1,2,3,6-tetrahydropyridine (0.28 g), which was recrystallized from ethyl acetate to afford colorless needles (0.15 g). mp : 157-159°C

IR (Nujol) : 3340, 3190, 3100, 1680  $\text{cm}^{-1}$

NMR ( $\text{CD}_3\text{OD}$ ,  $\delta$ ) : 2.36 (2H, m), 2.96 (2H, t, J=5.5Hz), 5.73 (2H, m), 7.0-7.6 (5H, m)

#### Example 37

A suspension of N-[[[4-fluorophenyl]carbamoyl]-iminol]pyridinium ylide (1.04 g) and sodium borohydride (2.55 g) in ethanol (100 ml) was stirred at ambient temperature for 16 hours. Excess of sodium borohydride was decomposed with water, and the resulting mixture was evaporated. The residue was extracted with chloroform (20 ml x 3). The combined organic extract was washed with water, dried over magnesium sulfate and evaporated to give crystals. Recrystallization from diisopropyl ether gave N-[[[4-fluorophenyl]-carbamoyl]amino]-1,2,3,6-tetrahydropyridine (0.60 g).
